## Introduction to the Rice Chemistry Undergraduate Program

Undergraduate students interested in studying chemistry benefit from Rice's renowned faculty members and a strong research program. The Department of Chemistry offers undergraduate chemistry majors a Bachelor of Science (B.S.) degree or a Bachelor of Arts (B.A.) degree. The Department also offers a Bachelor of Science degree in Chemical Physics.

**The B.S. in Chemistry degree** rigorously prepares students for a career in chemistry or a related discipline, and the degree requirements are consistent with the guidelines for certification by the American Chemical Society. This curriculum provides a broad and comprehensive introduction to core areas of chemistry while promoting depth of understanding in one or more specific fields. B.S. students complete a series of foundation courses in general chemistry, analytical chemistry, biological chemistry, inorganic chemistry, organic chemistry, and physical chemistry. Students then complete one or more specializations, or "tracks," consisting of in-depth courses both in and out of the specialization.

**The B.A. in Chemistry degree** is a more flexible program that provides a comprehensive overview of all areas of chemistry, including laboratory experiences, but can be coupled more easily with other majors or professional career paths.

**The B.S. in Chemical Physics degree** is offered in conjunction with the Department of Physics and Astronomy. Students take upper-level courses in both chemistry and physics, focusing on the applications of physics to chemical systems. For more information on this option, contact Prof. Bruce Weisman (Chemistry) or Prof. Stan Dodds (Physics).

### Follow Rice Chemistry!

#### [Chemistry Department Website](#)

- Our website contains all information on the Undergraduate program, as well as the Graduate program, Alumni, departmental events and awards, and specific faculty research and news articles.

#### [Facebook](#)

- Our Facebook page includes notifications of all seminars and Department events and news as well as all photos of Departmental events.

#### **LinkedIn:** *Search 'Groups' for 'Rice University Chemistry Department'*

- Our LinkedIn page is updated every time we receive news on job opportunities for those in the field of Chemistry.

### Rice Chemistry Student Organizations

**[Owlchemy: The Rice Undergraduate Chemistry Society](#)** formed from the merger of two previous undergraduate chemistry organizations, Owlchemy and RUCS. In addition to continuing Owlchemy's commitment to education through local volunteering and demonstrations, the club seeks to provide academic and career resources, serve as a liaison to the chemistry faculty and graduate students, and create a social network of support for Rice chemistry undergraduates. The club's mission is to improve the overall academic and social interactions of both incoming freshmen and upperclassmen while promoting the study of chemistry campus and community-wide.

**[American Chemical Society \(ACS\) Student Affiliates:](#)** Students can become an American Chemical Society Student Affiliate through participation in Owlchemy.

## Chemistry Major Advisors

The Chemistry Department has one faculty advisor for every residential college so that each student can form a consistent bond within the Department while completing their degree. Contact your Major Advisor with any questions or concerns you may have – they're here to help!

 <p><b>Baker College</b></p> <p>Dr. Kristi Kincaid  <a href="mailto:kincaid@rice.edu">kincaid@rice.edu</a>            Office: DBH 242            Phone: x5837</p>	 <p><b>Jones College</b></p> <p>Dr. Bruce Weisman  <a href="mailto:weisman@rice.edu">weisman@rice.edu</a>            Office: GRB W103            Phone: x3709</p>	 <p><b>Sid Richardson College</b></p> <p>Dr. Lon Wilson  <a href="mailto:durango@rice.edu">durango@rice.edu</a>            Office: DBH 353            Phone: x3268</p>

## Pursuing a Chemistry Degree

The guide below is designed to help you explore your academic interests in chemistry and to ensure that graduates have appropriate preparation for employment or graduate school in chemistry or related fields. If you are interested in pursuing a health profession, please refer to the resources provided by The Office of Academic Advising.

<b>First Year</b>	<b>Second Year</b>
<ul style="list-style-type: none"> <li>● Plan a tentative course of study with your Divisional Advisor and/or Major Advisor.</li> <li>● Take at least one CHEM course, in addition to the required MATH and PHYS courses.</li> <li>● Try to attend a departmental gathering, reception, or seminar to start meeting CHEM faculty and students.</li> <li>● Visit the Center for Career Development to learn about the education and skills required for possible careers in Chemistry.</li> <li>● Attend the Student Activities Fair and join Owlchemy.</li> <li>● Identify summer programs and job opportunities through the Chemistry website and the Rice Summer Opportunities Fair.</li> <li>● Strongly consider making arrangements to conduct research during the next academic year.</li> </ul>	<ul style="list-style-type: none"> <li>● Use the tips below, the General Announcements, the OAA website, and the CHEM website to determine your degree plan with your Major Advisor:               <ul style="list-style-type: none"> <li>- Not all courses are offered every year. Plan ahead to have flexibility in your schedule.</li> <li>- Complete all lower-level CHEM requirements by the end of your 2nd year.</li> <li>- Complete as many laboratory course requirements as possible by the end of the second year, which provides useful training for independent research in future years.</li> <li>- Check that you will complete at least the minimum required hours (48) at the 300 level or higher and that you will be able to complete at least 60 hours outside of your major requirements.</li> <li>- If you have not yet enrolled in CHEM 391, make arrangements to conduct research next year (B.S. degree candidates are expected to complete CHEM 391 before the end of their third year.)</li> </ul> </li> <li>● Apply for summer programs, research opportunities, internships, and/or study abroad programs.</li> </ul>
<b>Third Year</b>	<b>Fourth Year</b>
<ul style="list-style-type: none"> <li>● Apply to attend a research conference or symposium and consider presenting your research.</li> <li>● Consider post-graduation plans. Begin gathering information about graduate schools or employment sectors.</li> <li>● Speak with faculty members, advisors, and other mentors about post-graduation plans.</li> <li>● Begin preparing CV and personal statements.</li> <li>● Register and prepare for relevant standardized tests.</li> <li>● Look for scholarship and fellowship opportunities.</li> <li>● Request letters of recommendation from faculty.</li> </ul>	<ul style="list-style-type: none"> <li>● Complete remaining degree requirements.</li> <li>● Complete and submit employment and/or graduate applications.</li> <li>● Request additional letters of recommendation, if necessary.</li> <li>● Consider taking time off before starting work and/or graduate school, and discuss this possibility with your advisor.</li> </ul>

## Frequently Asked Questions

### The Basics

**What's the difference between Chemistry and Chemical Engineering?** While there is much overlap between the disciplines, the major differences between chemistry and chemical engineering have to do with originality and scale. Chemists are more likely to develop fundamentally new chemicals, materials, or techniques, while chemical engineers are more likely to apply known materials or ideas to effectively solve real-world problems. Here is one useful [external link](#) regarding this topic.

**Is it better to get a B.S. rather than a B.A. in Chemistry?** Neither degree is necessarily "better" — it depends on your career path. Your specific experiences, coursework, and achievements during your time at Rice are more important for job or graduate school applications than the type of degree you earn. With that said, the B.S. degree is designed to provide the experiences necessary for a career in chemistry, including pursuing graduate school or laboratory research jobs in chemistry-related fields. On the other hand, the B.A. degree is designed for students interested in a broad range of careers that value scientific knowledge, rigorous analytical skills, and quantitative abilities, but who are not interested in laboratory research. Health professions and high school teaching are two examples of careers for which the B.A. degree is good preparation. Because it has lower credit hour requirements, some students find the B.A. degree convenient as part of a double major. Please seek advice from an academic advisor to determine which degree is best suited for your career path.

**I want to earn degrees in both Chemistry and History. Can I do it?** Yes. Although it is demanding, many students do complete the requirements for two majors in disparate fields. Note that Rice offers two options in this case: a "double major" or a "dual degree." The majority of such students complete a "double major," which is earned by completing the requirements for a B.A. in two different disciplines. A "dual degree" requires the completion of two different bachelor's degrees (i.e. B.A. and B.S.) in two different disciplines and at least 30 additional semester hours at Rice beyond the hours required for the first degree. More information may be found in the [General Announcements](#).

**I will complete all of the requirements for my major but how can I be sure I have my 60 hours outside the major?** All courses not specifically applied to your major requirements count as "outside" the major, even courses taken in the same discipline. For example, if you complete all the course requirements listed for a B.A. in Chemistry and take two extra CHEM courses, those courses count toward the additional 60 hours needed to graduate. Please review your Degree Works account with an academic advisor to audit your graduation requirements.

### For Freshmen

**Should I take PHYS 101/102, PHYS 111/112, or PHYS 125/126?** All three sequences fulfill the physics requirement for the B.A. and B.S. in Chemistry. PHYS 101/102 is intended for students majoring in engineering or the physical sciences, PHYS 125/126 for bioscience and premedical students, and PHYS 111/112 for particularly well-motivated students with a strong interest in the physical sciences. You may refer to the Office of Academic Advising (OAA) for more information on course placement.

**Which Chemistry class should I take as a freshman?** Most freshmen will take a full-year course in general chemistry, either CHEM 121/122 or CHEM 151/152. Organic Chemistry I (CHEM 211) is typically taken during the second year at Rice. However, some students with a strong AP/IB Chemistry background choose to take organic chemistry during their freshman year. (Note: CHEM 211 is offered in both the fall and spring semesters.) See the handout "[Which Chemistry Class is Right for Me?](#)" for more information.

**I have AP/IB Chemistry credit. Will this satisfy pre-health professions requirements?** This is a question that must be answered on a case-by-case basis. In general, AP/IB credit will satisfy some pre-medical requirements for many, but not all, medical and other health professional schools. Students need to consult with the OAA or each school for their AP/IB policies.

## Current Majors

**Should I take CHEM 212 or CHEM 320?** In brief, chemistry majors should take CHEM 320. Both CHEM 212 and CHEM 320 count toward the undergraduate chemistry degrees, and both are excellent courses that have been well-liked by students in recent years. CHEM 212 is primarily taught as a large lecture course much like CHEM 211. CHEM 320 is a small course —12 to 25 students — and is intended for students considering chemistry as a major and those in related fields with a strong interest in chemical research. Taught in small groups, CHEM 320 minimizes traditional lecture time, and significant course time is spent on small group problem-solving work and applying fundamental concepts to new application, mechanism and arrow-pushing, and multistep synthesis. Memorization is de-emphasized. Both courses use the same textbook, though CHEM 320 may cover 1-2 additional chapters of material that are more important to chemists than a general audience. CHEM 320 also serves as an introduction to the department and to independent research in chemistry. Some class discussion is designed to help students find a research lab in chemistry and to work toward a career related to chemistry.

**Can I pursue summer school, study abroad, and internship opportunities as a CHEM major?** Chemistry course credit earned from summer school and study abroad programs is allowed. Interested students should refer to the Transfer Credit Policy found in this booklet and obtain approval from the transfer credit advisor in advance of enrolling in summer coursework. The Department encourages student participation in study abroad programs. Course substitutions completed through summer school and study abroad programs must be approved through the Office of the Registrar and the Department of Chemistry. Most students who want to do internships complete them in the summer, but academic-year internships are also possible. Please consult with the Study Abroad office and an academic advisor to design a four-year schedule that allows for study abroad and/or internship opportunities.

**If I'm not doing well in one of my prerequisites, should I not be a CHEM major?** Many successful chemists have struggled in undergraduate courses. You can overcome adversity if chemistry is the field you want to study. There are many reasons why students do not perform at their best, and there are tremendous resources at Rice to help. However, it is the student's responsibility to take initiative when they are struggling in a course, and their greatest mistake is to wait too long before seeking academic assistance. Students should consult their professor for help with a specific course, utilize their residential college's Academic Fellows/Mentor Society, and see an academic advisor to discuss options if they are struggling with multiple courses.

**Can I Pass/Fail a chemistry course as a CHEM major?** Courses taken as Pass/Fail cannot be used to meet major requirements. If required courses are taken pass/fail, the Registrar will replace the P with the letter grade earned during the final degree audit. If you have multiple courses that could be used to fulfill the same major requirement, address any potential problems with your major advisor prior to your final degree audit.

**Can I earn credit for chemistry research?** Yes, you may enroll in Research for Undergraduates (CHEM 391/491/492/493) to earn credit for independent research. B.S. students must complete 8 credit hours of chemistry research (corresponding research courses in other departments in Science and Engineering may be used towards this requirement with departmental approval). CHEM 391 is the standard independent research course for first-time lab students, while CHEM 491 is for continuing lab students that is repeatable for credit. The Chemistry Honors Research Program, CHEM 492/493, offers students in their final year at Rice the opportunity to perform a two-semester, individual chemistry research project. These courses function as a pair and must be taken in the same academic year. Students must formally apply into CHEM 492/493 with the recommendation of their research professor. The course requires students to complete a research proposal, a public presentation of findings, and a formal report or thesis. For more information, refer to the [Undergraduate Research Opportunities](#) section.

**How do I get involved in chemistry research?** There are many ways to find research opportunities as a Rice undergraduate. The most common method to join a lab in the Chemistry Department is to contact the faculty member directly about working in their lab for course credit. For more information and suggestions, please refer to the [How Do I Find a Research Opportunity?](#) section.

## Life After Rice

**What are some post-graduation options for me if I graduate with a CHEM degree (aside from medical school or grad school)?** You have many options, especially if you are not geographically limited. Often, these are jobs in chemical industry (including biotechnology) or science education. Other relevant career paths include conservation, science writing, science policy, scientific/medical illustration, forensic science, management consulting, and patent law. Please meet with your Chemistry major advisor and the Center for Career Development for more information.

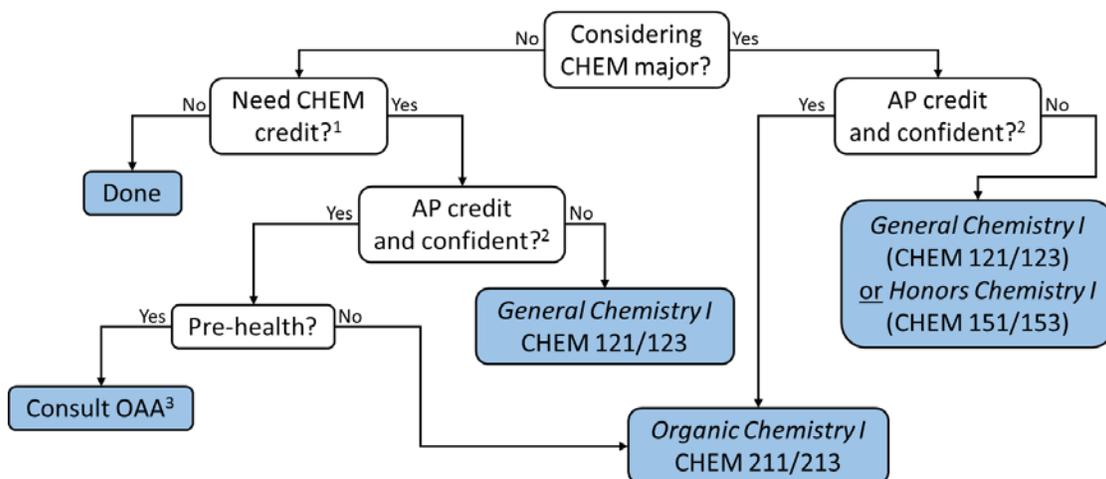

**Which graduate programs have recent CHEM undergraduates been accepted to?** In the past five years, our recent Chemistry majors have gone on to graduate school (Harvard, MIT, Northwestern, Caltech, UC Berkeley, and more), as well as medical, pharmacy, and dental schools.

**How important is my GPA for getting into graduate school?** Admissions committees typically place considerable weight on the GPA, especially in math and science courses. The admission committee will also place a heavy emphasis on undergraduate research experience and the recommendation of the student's research mentor. However, every part of each student's application is examined closely by the admissions committee, so there is no single element that would make or break a student's admission. Among other factors, students with a strong research record that includes publication in a peer-reviewed journal are looked upon favorably.

**What are good resources for investigating my options and choosing graduate schools to apply to?** First, examine the American Chemical Society website. Second, speak with your Chemistry major advisor and research advisor to find ideal graduate programs to which you should apply that best match your research interests and career path.

## Which Chemistry Class is Right for Me?

This document is designed to help you select the appropriate chemistry course to take during your first year. For any questions, please refer to the notes below and consult an appropriate academic advisor.

### CHEM 121/123 – General Chemistry I and General Chemistry Laboratory I

CHEM 121 is the first-year chemistry course most freshmen take. It is an introduction to chemical phenomena, suitable for a wide variety of student backgrounds and interests. The course emphasizes concept development, problem solving, and foundational methods in chemistry. Students must also register for CHEM 123. Please refer to the CHEM 123 syllabus for important information regarding lab enrollment.

### CHEM 151/153 – Honors Chemistry I and Honors Chemistry Laboratory I

CHEM 151 is a first-year chemistry course aimed at students who plan on majoring in a chemistry-related field and/or taking upper division chemistry courses. It is a deeper introduction to chemical phenomena emphasizing principles and theories. A strong command of high-school chemistry, with or without AP credit, is expected. This course is strongly recommended for prospective chemistry majors, although CHEM 121 is also suitable for the Chemistry major requirements. Students must also register for CHEM 153.

### CHEM 211/213 – Organic Chemistry I and Organic Chemistry Discussion

CHEM 211 is often taken during the second year at Rice, but some students with a very strong AP chemistry background are adequately prepared to take this course during their freshman year. This course covers organic molecules, with emphasis on structure, functional groups, bonding, and reaction mechanisms. CHEM 211 is offered both fall and spring semesters; some students elect to wait until the spring semester to take CHEM 211, for a variety of reasons. There is no laboratory course accompanying CHEM 211. The organic chemistry laboratory course (CHEM 215) is typically taken together with *Organic Chemistry II* (CHEM 212/320). Students must also register for CHEM 213.

#### Notes:

1. **Need CHEM credit?** Not all degrees require chemistry beyond the first year — please check the General Announcements for more information regarding specific degree requirements. All pre-health professional tracks require at least one year of chemistry. AP Chemistry credit counts towards the Group 3 distribution requirement. Of course, you may take additional chemistry coursework as an elective.
2. **Confident?** Many students who have AP Chemistry credit are not confident in their knowledge of chemistry. This may depend on the quality and rigor of your high school courses or on the length of time since you last took a chemistry course. Many students find it helpful to take General Chemistry at Rice, and thus forgo their AP credit, to solidify their background for advanced chemistry coursework or for professional school requirements. Students interested in majoring in chemistry are strongly encouraged to speak to a major advisor to determine the best first-year course to take.
3. **Consult OAA.** Some medical schools may not accept AP credit for application to medical school. As such, you should seek advice about whether to take your AP credit. Contact the [Office of Academic Advising](#) (OAA) for more information.

## Degree Requirements for the B.S. in Chemistry

The B.S. in Chemistry requires at least 129 credit hours, including at least 69 credit hours of chemistry requirements (listed below in a checklist format).

### General Chemistry

Course	Semester Taken	Year Taken	Credits
CHEM 151/121			3
CHEM 152/122			3
CHEM 153/123			1
CHEM 154/124			1

### Chemistry Foundation

Course	Semester Taken	Year Taken	Credits
CHEM 211			3
CHEM 301			3
CHEM 302			3
CHEM 330			3
CHEM 360			3
BIOC 301			3
CHEM 220*			1

\*BIOC 201 is a prerequisite for BIOC 301, but the Biosciences Department confirmed that CHEM majors are waived from the BIOC 201 prerequisite. Students need to special register for BIOC 301.

\*CHEM 220 is recommended (not required) of all B.S. majors prior to enrolling in CHEM 391, and expected of all juniors not yet enrolled in CHEM 391.

### Mathematics\*

Course	Semester Taken	Year Taken	Credits
MATH 101/105			3
MATH 102/106			3
MATH 212/222			3

\*The Department of Mathematics may, after consultation with a student concerning his/her previous math preparation, recommend that a student be placed into a higher level math course than that for which the student has received official credit. The Department of Chemistry will accept this waiver of the math classes upon a written confirmation of the waiver from the Department of Mathematics and upon the student's successful completion of the higher level math course. Note: MATH 211 is encouraged for students interested in graduate study.

### Physics

Course	Semester Taken	Year Taken	Credits
PHYS 101/111/125			4
PHYS 102/112/126			4

### Advanced Laboratories \*Complete 3 of 5\*

Course	Semester Taken	Year Taken	Credits
CHEM 365			2
CHEM 366			2
CHEM 367			2
CHEM 368			2
BIOC 311			2

### Research \*At Least Eight (8) Credit Hours\*

Course	Semester Taken	Year Taken	Credits
CHEM 391*			
**			
**			
**			

\*Normally completed before the end of junior year. Enrollment in CHEM 391 (at least 3 credits) requires advance permission. See course guide for details.

\*\*Additional independent research or laboratory coursework in chemistry must be completed to total eight (8) credit hours (including CHEM 391). This requirement may be satisfied by taking one or more of the following: (i) CHEM 491, (ii) CHEM 492 and 493, and (iii) additional laboratory course(s) in chemistry at the 300-level or above. Up to two (2) credits of CHEM 700 may be used toward this requirement.

### Advanced Work \*Complete Twelve (12) Credit Hours\*

Each student must complete advanced work that satisfies one of the specialization tracks listed below. A student may, with the approval of the Director of the Undergraduate Program, propose a track in another specialization. See the General Announcements for details.

Course	Semester Taken	Year Taken	Credits

#### Specialization in Biological and Medicinal Chemistry

CHEM 212/CHEM 320, BIOC 302, Six (6) additional credit hours

#### Specialization in Inorganic Chemistry and Inorganic Materials

CHEM 475, CHEM 495, Six (6) additional credit hours

#### Specialization in Organic Chemistry

CHEM 212/CHEM 320, CHEM 401, Six (6) additional credit hours

#### Specialization in Physical and Theoretical Chemistry

CHEM 420, CHEM 430, Three (3) credit hours from CHEM 415, 531, or 559, Three (3) credit hours of advanced coursework in PHYS or MATH

"Advanced coursework" includes CHEM 212, CHEM 320, BIOC 302, and chemistry courses at the 400-level or higher. Courses in other departments at the 400-level or higher with substantial chemistry content may count toward this requirement with approval of the Director of the Undergraduate Program.

## B.S. in Chemistry - Sample Degree Plan without Chemistry AP credit

FALL			SPRING

Total = 130 credit hours

Note: While the above sample degree plan suggests 19 credit hours of independent research, the B.S. degree requires at least 8 credit hours. There is a lot of flexibility in the completion of advanced coursework. However, not all courses are taught every year – consult with your major advisor about your course plan.

## B.S. in Chemistry - Sample Degree Plan with Calculus AB and Chemistry AP credit

Total = 121 credit hours

Note: The above sample degree plan assumes that Calculus AB and Chemistry AP credit were earned upon entering Rice, which would satisfy MATH 105 and CHEM 121/122/123/124, respectively. While the above sample degree plan suggests 19 credit hours of independent research, the B.S. degree requires at least 8 credit hours. There is a lot of flexibility in the completion of advanced coursework. However, not all courses are taught every year – consult with your major advisor about your course plan.

## Degree Requirements for the B.A. in Chemistry

The B.A. in Chemistry requires at least 120 credit hours, including at least 55 credit hours of chemistry requirements (listed below in a checklist format).

### General Chemistry

Course	Semester Taken	Year Taken	Credits
CHEM 151/121			3
CHEM 152/122			3
CHEM 153/123			1
CHEM 154/124			1

### Chemistry Foundation

Course	Semester Taken	Year Taken	Credits
CHEM 211			3
CHEM 301/302 /BIOC 352			3
CHEM 301/302 /BIOC 352			3
CHEM 330			3
CHEM 360			3
BIOC 301			3

\*BIOC 201 is a prerequisite for BIOC 301, but the Biosciences Department confirmed that CHEM majors are waived from the BIOC 201 prerequisite. Students need to special register for BIOC 301.

### Mathematics\*

Course	Semester Taken	Year Taken	Credits
MATH 101/105			3
MATH 102/106			3
MATH 212/222			3

\*The Department of Mathematics may, after consultation with a student concerning his/her previous math preparation, recommend that a student be placed into a higher level math course than that for which the student has received official credit. The Department of Chemistry will accept this waiver of the math classes upon a written confirmation of the waiver from the Department of Mathematics and upon the student's successful completion of the higher level math course. Note: MATH 211 is encouraged for students interested in graduate study.

### Physics

Course	Semester Taken	Year Taken	Credits
PHYS 101/111/125			4
PHYS 102/112/126			4

### Advanced Laboratories \*Complete 3 of 5\*

Course	Semester Taken	Year Taken	Credits
CHEM 365			2
CHEM 366			2
CHEM 367			2
CHEM 368			2
BIOC 311			2

### Advanced Coursework \*Complete Six (6) Credit Hours\*

Six (6) credit hours of additional advanced coursework in chemistry. For purposes of this requirement, "advanced coursework" includes chemistry courses at the 400-level or higher. CHEM 212 or CHEM 320 or BIOC 302 counts as "advanced coursework" for purposes of this requirement. Courses in other departments with substantial chemistry content may count toward this requirement with approval of the Director of the Undergraduate Program.

Note: The above sample degree plan assumes that Calculus AB and Chemistry AP credit were earned upon entering Rice, which would satisfy MATH 105 and CHEM 121/122/123/124, respectively. Also note that there is a lot of flexibility in the completion of advanced coursework. However, not all courses are taught every year – consult with your major advisor about your course plan.

## Transfer Credit Policy

The Department of Chemistry grants transfer credit for chemistry courses taken during the summer or during study abroad programs according to the rules and procedures established in the Rice University General Announcements and as administered by the Office of the Registrar.

In order to satisfy the Department's ruling on transfer credit, the course must typically be taken at a four-year college or university that offers a degree in chemistry certified by the American Chemical Society (information regarding certified programs is available on the [ACS website](#)). The course should be one that counts toward the chemistry degree at that school. Prior to registration, students should obtain pre-approval using the Undergraduate Request for Transfer Credit which is available from the Office of the Registrar.

Courses for transfer credit after matriculation for General Chemistry (CHEM 121 and/or CHEM 122) and the laboratory (CHEM 123 and/or CHEM 124) must contain a laboratory component or must involve co-enrollment in associated lecture and laboratory courses. Any student who has taken CHEM 121 and/or CHEM 122 at an alternate institution must receive instructor approval to take the lab credit on the Rice campus.

Students should follow these steps to obtain transfer credit approval:

1. Complete an Undergraduate Request for Transfer Credit form, found on the Office of the Registrar's website.
2. Write a cover letter describing why you wish to obtain transfer credit. Describe the start and end dates, as well as the meeting times of the course during the term. This letter should include your contact information (campus or local address, phone number, email address).
3. Obtain course syllabus and copies of materials from the college or university showing the course number, course description and enough information to indicate that the course to be taken is the equivalent that chemistry majors take at Rice.
4. Deliver all materials to Anita Walker, Undergraduate & Classroom Coordinator, located in Dell Butcher Hall 243. Questions concerning transfer credit should be directed to Ms. Walker at 713-348-4027 or [aawalker@rice.edu](mailto:aawalker@rice.edu).

You may elect either to pick-up the processed form or to have it returned via campus mail so that you may submit the form to the Registrar. Please allow one week for processing of the transfer credit request.

## Course Load Policy

Students at Rice normally enroll for 15 to 17 semester credit hours each semester. For most students, this allows completion of graduation requirements in 8 semesters. In some instances a student may feel the need to petition for a registration overload. Petitioning for a registration overload should be a last resort and only for students with truly extenuating circumstances that would necessitate a course overload.

### For Students who Matriculated to Rice Prior to Fall 2016 Semester:

- Students must secure permission in writing from the Office of the Academic Advising to register **for more than 20 credit hours** in any semester. Guidelines and the petition form can be found on the [Academic Advising website](#).
- Petitions for more than 24 credit hours are not considered.
- No student may receive credit for more than 20 semester credit hours in a semester, including courses taken elsewhere, without prior written approval.

### For Students who Matriculated to Rice in the Fall 2016 Semester, and thereafter:

- Students must secure permission in writing from either the Office of the Academic Advising or the Chemistry major advisor for course overloads, Dr. Lesa Tran Lu ([lesa@rice.edu](mailto:lesa@rice.edu)), to register **for more than 18 credit hours** in any semester.
- Updated guidelines (as of Fall 2017) and a new process and timeline for petition approval can be found on the [Academic Advising website](#).

## Undergraduate Research Opportunities

Undergraduate students have a unique opportunity to perform research in one of our many interdisciplinary research labs. Most chemistry research students are chemistry majors. Chemistry majors seeking a B.S. degree are required to take at least eight credit hours of research through CHEM 391, 491, 492, and 493.

Although many Chemistry majors work with Rice Chemistry professors, we also encourage and support students doing research in other Rice science departments or in the Texas Medical Center (TMC). To earn credit for your research, students must have their research proposal approved by the CHEM 391/491 Course Instructor. To be approved for credit in the chemistry department, the research should have something to do with chemistry (defined broadly) and should be set up to provide a positive research experience.

Students should expect to spend at least 3 hours per week (or at least 42 hours over the course of the semester) for each credit hour. In the first semester of independent research, students should enroll in CHEM 391 for at least 3 credit hours before the end of their junior year. Prior to enrollment, students must secure a position in a laboratory. In subsequent semesters, students should enroll in CHEM 491 for independent research (or CHEM 492/493 for honors thesis research) and may choose the appropriate number of credit hours with approval from their Research Advisor.

CHEM 491 is repeatable for credit and students wishing to pursue graduate school or other careers in research and applied science are encouraged to gain as much research experience as possible. Students are not limited to one lab, and may choose another lab in subsequent semesters. A major advantage of continuing in one lab may include obtaining results to co-author a publication.

### Undergraduate Honors Research, CHEM 492 (Fall) and CHEM 493 (Spring)

The Chemistry Honors Research Program, CHEM 492/493, offers students in their final year at Rice the opportunity to perform a two-semester, individual chemistry research project. These courses function as a pair and must be taken in the same academic year. Course requirements include (but are not limited to) completing a research proposal, a public presentation of findings, and a formal research report or thesis in the Spring term. Students must formally apply into CHEM 492/493 with the recommendation of their Research Advisor. If you are conducting research for a thesis outside the Chemistry Department you must have an on-campus Chemistry Department secondary advisor. Applications must be submitted to the course instructor February 1 - August 1 (early application submission is highly encouraged). Students who complete the Chemistry Honors Research Program are given primary consideration for "Distinction in Research and Creative Work," a university award for select undergraduates, chosen by the Department and granted at commencement, which appears on the transcript and diploma.

### How do I register for Undergraduate Research?

First, start planning far in advance. Before enrolling in CHEM 391/491/492/493, you must be accepted into a laboratory (see [How Do I Find a Research Opportunity?](#) for more information.) The deadline for course enrollment is several weeks before the start of the semester. Some labs may have extensive laboratory or safety training that must be completed before the start of the semester. Labs at the Texas Medical Center often have access control regulations that require filling paperwork months in advance of starting in the lab.

Once you have secured a research position, you must fill out the online application found on the Chemistry Department website. The online application must be submitted by August 1st for the Fall term, December 1st for the Spring term, or April 1st for the Summer term to ensure enrollment in CHEM 391/491/492/493. Once you have submitted the online application, the Course Instructor will verify your position and proposed research project with the Research Advisor and then submit a registration override via Esther. No paper special registration form is required to be signed or submitted, and only the Course Instructor (not Research Advisors) is authorized to enroll students. If you have any questions about enrollment, please contact the Course Instructor.

## How Do I Find a Research Opportunity?

### Where do I start?

If you are a chemistry major, you probably want to begin by looking for positions in the Chemistry Department. Positions are generally not advertised, so the best approach is simply to investigate online and contact any faculty member whose research interests you regardless of whether research opportunities have been posted. To find out which faculty members are working in areas that you find intriguing, please refer to [Appendix A](#), the [Chemistry Department website](#), or the [Chemistry Undergraduates Research page](#) on Canvas.

There are lots of options for undergraduate research, but do not be overwhelmed by them! It is not possible to collect all of the information about every lab and then put the data through some algorithm to identify the best lab for you. Random circumstance often governs which lab a student joins—many labs are particularly popular at one college because many people join the lab where their friends work. Look for a lab that is interesting to you. Talk to juniors and seniors, as well as your graduate student TAs, about their lab experiences. Which labs do they recommend? Contact chemistry professors with whom you've taken classes for advice about labs. The CHEM 391/491 Course Instructor is happy to meet with you to help identify a good match. If you are serious about joining a particular research group, visit the lab, ask to meet the undergrads already working there, and inquire as to the best method of approaching that particular professor.

### How do I contact professors with whom I might want to work?

Do your homework. Most positions are not advertised, but are filled from among the students who contact faculty members. Read about each lab's research and try to talk with current group members to get a feel for the personality and expectations of the faculty member. Write a personal email to the faculty member. Do not send a mass email to multiple faculty members or your email will be considered spam and ignored.

Your introductory email conveys an important first impression and can influence how easy it will be for you to find a lab home. All heads of research labs have either a PhD or an MD degree and should be addressed as "Prof." or "Dr." or and not "Ms., Mrs., or Mr." In your email, tell the professor who you are (name, year at Rice), why you are looking for a position in a research lab, and why you are interested in his or her lab in particular. Describe any relevant course work or prior research experience, even if it was in high school. You also may want to include whether you are looking for a short (1 semester) or longer experience, and how many hours per week you can commit to lab work. If you are considering graduate school after Rice, include this interest in the letter.

### How many labs should I contact?

Getting into a lab is partly timing and luck, so do not be discouraged if your first efforts are not successful. It's usually necessary to contact several labs to find a position. If you know someone in a lab where you want to work, ask that person to put in a good word for you. If you are not successful after several attempts, you may wish to ask the Course Instructor for feedback on your contact letter. Additional information about research opportunities and finding an advisor can be found by contacting the CHEM 391/491 Course Instructor.

### Are there prerequisite courses I must take before joining a research lab?

Most students joining a lab have some background in inorganic chemistry from a general chemistry course or CHEM 360, and many will have taken organic. You may not have taken courses in other areas of chemistry by the time you join a lab, but you can envision many interfaces between chemistry and other fields. Physical chemistry is a great direction to go if you like physics and chemistry, and bio-organic chemistry is the interface between biological chemistry and organic. People who have strong interests or background in mathematics and/or computer science might consider becoming theoreticians or computational chemists. Rice has a rich history of excellence in nanotechnology, which has applications in almost all areas of chemistry, from biochemistry to materials science.

### Should I consider conducting research at the Texas Medical Center?

The Texas Medical Center holds enormous possibilities to do research, and students who are headed to medical school might be particularly interested in the possibility of working at the medical center. Nevertheless, several factors complicate off-campus research, which should not be taken lightly:

- 1) Travel time — The trip may take 10–35 minutes, depending on where you work, and reduces the amount of time you have to spend in the lab.
- 2) Hard to drop in for a few minutes — Sometimes when you have a break between classes you will want to drop into lab for a few minutes to start a reaction, check on an analytical run or a calculation, or talk to your professor. These few minutes can often give you a head start or eliminate waiting time when you have your next block of time in the lab. The distance problem can preclude popping in and out of an off-campus lab.
- 3) Cultural differences between Rice and other TMC institutions — Most labs at the medical center are less accustomed to working with undergraduate researchers and may be less accommodating of undergraduate schedules and instructional needs.
- 4) Paperwork and safety training courses — Additional paperwork and safety training courses are required for most off-campus labs, so you will have to budget extra time to complete these before beginning research.

However, students who have prepared for these complexities have an unusual opportunity to undertake medical research as an undergraduate student. A hybrid approach is to join a Rice lab that works closely with TMC faculty. Please see the CHEM 391/491 Course Instructor if you would like leads in these directions.

### **Are there paid research opportunities?**

Most undergraduate research during the school year is done for credit. In many labs, paid positions during the school year are limited to lab maintenance or very routine work, and actual research will only be available for students working for credit during the academic year. However, many labs offer some paid positions over the summer. Some professors do try to set up paid research positions during the school year for students who are eligible for work-study. Note: students cannot simultaneously earn course credit and be paid for their research.

Also, there are a limited number of summer research fellowship opportunities within the Chemistry department, such as the Dr. Paul S. Engel Fellowship, the George Holmes Richter Memorial Fellowship and the Zevi & Bertha Salsburg Memorial Fellowship in Chemistry. See [Departmental Awards & Fellowships](#) for more information.

## Departmental Awards & Fellowships

Undergraduate students have several opportunities to win awards and summer research fellowships from the Department of Chemistry. Below is information providing the background of each award. Information on how to apply for any of the summer research fellowships will be sent out to the Chemistry Undergraduate listserv near the end of the Fall semester. Be on the lookout! (Note: students can join the listserv by emailing [chemhelp@rice.edu](mailto:chemhelp@rice.edu).)

 <p><b>Paul S. Engel Fellowship</b> Awarded to a promising chemistry undergraduate in partial support of a chemistry summer research internship</p>	 <p><b>Arthur L. Draper Award</b> Awarded in recognition of exceptional undergraduate performance in chemistry coursework</p>
 <p><b>George Holmes Richter Memorial Fellowship</b> Awarded to a promising chemistry undergraduate in partial support of a chemistry summer research internship</p>	 <p><b>Zevi &amp; Bertha Salsburg Memorial Fellowship in Chemistry</b> Awarded to a promising chemistry undergraduate in partial support of a chemistry summer research internship</p>

## Distinction in Research & Creative Work

The *Distinction in Research and Creative Work* is a University award for select undergraduates, granted at Commencement, which appears on the transcript and diploma. More specifically, in the Chemistry Department, this award recognizes Rice B.S. chemists whose research discoveries will form a substantial component of an important publication. The submission and review processes are often not fast enough for researchers to see their work in print before graduation. A pre-publication formal description of the research (e.g., a submission-ready manuscript or a CHEM 492/3 Honors Thesis or the equivalent) with a detailed accounting of the nominee's contribution and those of other authors is sufficient. Applicants must also be in good academic standing and have a cumulative GPA of at least 3.30 in courses completed at Rice.

### Required Application Materials:

1. Declaration of intention to apply for this distinction.
2. Documentation of research achievement in the form of published papers, theses, pre-publication manuscripts, electronic files of presentations (PowerPoint or poster) given off-campus.
3. A supporting letter from the research advisor which should detail the student's research accomplishments and intellectual contributions.

**Deadline for Final Submission of Materials:** Last day of classes of semester before graduation

**Please send all application materials to Nancy Neil:** [nancy.neil@rice.edu](mailto:nancy.neil@rice.edu)

## Appendix A: Chemistry Faculty and their Research Interests

Our Department's faculty have a wide variety of research interests and hold joint appointments with <sup>1</sup>Biosciences, <sup>2</sup>Bioengineering, <sup>3</sup>Chemical & Biomolecular Engineering, <sup>4</sup>Computer Science, <sup>5</sup>Earth Science, <sup>6</sup>Electrical & Computer Engineering, <sup>7</sup>Material Science & NanoEngineering, <sup>8</sup>Physics & Astronomy, and <sup>9</sup>Civil & Environmental Engineering.

**Pulickel Ajayan**<sup>3,7</sup>, PhD (Northwestern, 1989). Multi-functional nanostructures and hybrid platforms for energy storage, composites, sensors, electronics, and biomedicine.

**Pedro Alvarez**<sup>7,9</sup>, PhD (U of Michigan, 1992). Bioremediation of contaminated aquifers, fate and transport of toxic chemicals, and environmental implication and application of nanotechnology.

**Zachary Ball**, PhD (Stanford, 2004). Chemical biology. Protein chemistry. Organic synthesis, bioinorganic, and medicinal chemistry.

**Gang Bao**<sup>2</sup>, PhD (Lehigh, 1987). Nanotechnologies and biomolecular engineering approaches for basic biological studies and medicine.

**Enrique Barrera**<sup>7</sup>, PhD (UT Austin, 1987). Formation of hybrid nanotube materials and the development of fully integrated nanotube composites.

**Andrew Barron**<sup>7</sup>, PhD (Imperial College, U of London, 1986). Chemistry, nanoscale science and materials science of the Group 13 elements leading to the development of new materials and catalysts.

**Cecilia Clementi**<sup>3</sup>, PhD (International School for Advanced Studies, 1998). Theoretical and computational investigation of protein folding, protein interactions and functions.

**Michael Diehl**<sup>2</sup>, PhD (UCLA, 2002). Biomotor cooperativity, biomaterials, supramolecular biophysics and molecular bioengineering.

**Paul Engel**, PhD (Harvard, 1968). Free radical initiators, inhibitors of polymerization, free radical of single walled carbon nanotubes with organic free radicals.

**Jason Hafner**<sup>8</sup>, PhD (Rice, 1998). Application of nanometer-scale tools and materials to problems of biological and biomedical interest.

**Naomi Halas**<sup>2,6,7,8</sup>, PhD (Bryn Mawr, 1987). Nanofabrication chemistry and nano-optics.

**Jeffrey Hartgerink**<sup>2</sup>, PhD (Scripps, 1999). Self-assembly of nanostructured materials with a focus on molecular structures of proteins and peptide based

biomaterials for tissue regeneration, drug delivery and other biomedical applications.

**John Hutchinson**, PhD (UT Austin, 1980). Chemical education

**Matthew Jones**, PhD (Northwestern, 2014). Nanoparticle synthesis, surface chemistry, supramolecular chemistry, soft matter assembly, and liquid-phase electron microscopy

**Anatoly Kolomeisky**<sup>3</sup>, PhD (Cornell, 1998). Theoretical physical chemistry, biophysics and statistical mechanics. Modeling of biological transport systems and protein-DNA interactions, and investigation of nanocars and other artificial nanoscale devices.

**László Kürti**, PhD (Penn, 2006). Synthetic Organic Chemistry. Specializes in the development of new catalytic asymmetric transformations, modes of chirality transfer, methods for the synthesis of bioactive N- and O-heterocycles as well as novel aminating agents & transition metal-free amination reactions.

**Christy Landes**<sup>6</sup>, PhD (Georgia Tech, 2003). Experimental physical, biophysical, and nanomaterials physical chemistry; single molecule spectroscopy. Dynamic complexity and its role in biological and synthetic polymer functions.

**Stephan Link**<sup>6</sup>, PhD (Georgia Tech, 2000). Physical chemistry of nanomaterials, nanophotonics and plasmonics, spectroscopy of individual & coupled nanoparticles with applications in opto-electronics, energy, and medicine.

**Jun Lou**<sup>7</sup>, PhD (Princeton U, 2004). Nanomaterial synthesis, nanomechanical characterization and nanodevice fabrication for energy, environment and biomedical applications.

**Angel Marti**<sup>2,7</sup>, PhD (U Puerto Rico, 2004). Development of molecules to diagnose and treat disorders that involve protein aggregates, e.g. Alzheimer's; development of supramolecular materials based on nanoscale building blocks.

**Frederick MacKintosh**<sup>3</sup>, PhD (Princeton, 1989). Fundamental properties of biological and soft matter networks.

**Carrie Masiello**<sup>5</sup>, PhD (U of California, Irvine, 1999). Fundamental mechanisms of the carbon cycle, carbon sequestration, climate change, black carbon, terrestrial-river-ocean biosphere interactions.

**Seiichi Matsuda**<sup>1</sup>, PhD (Harvard, 1994). Bioorganic and organic chemistry, terpenoid biosynthesis, enzyme evolution, redesign of enzymes to have new activities, and genomic approaches to find biologically active molecules.

**Antonios Mikos**<sup>3,7</sup>, PhD (Purdue U, 1988). Synthetic biodegradable polymers as supportive scaffolds for cells, as conduits for guided tissue growth, as specific substrates for targeted cell adhesion, or as stimulants for a desired cellular response.

**Emilia Morosan**<sup>7,8</sup>, PhD (Iowa State, 2005). Design and synthesis of novel magnetic and superconducting materials.

**K.C. Nicolaou**, PhD (U London, 1972). Specializes in organic chemistry with a focus on the synthesis of natural and designed molecules of biological and medical importance to cancer research.

**Jose Onuchic**<sup>1,8</sup>, PhD (Harvard, 1976). Theoretical and computational methods for molecular biophysics and chemical reactions in condensed matter; protein folding funnels as a mechanism for the folding of proteins.

**Matteo Pasquali**<sup>3,7</sup>, PhD (Minnesota, 1999). Interaction of flow and liquid micro- and nanostructure in complex fluids, with application to the manufacturing of engineered materials.

**George Phillips**<sup>1</sup>, PhD (Rice, 1976). Three-dimensional structure and dynamics of proteins to their biological functions, computational biology.

**Peter Rossky**<sup>3</sup>, PhD (Harvard, 1978). The elucidation of the fundamental molecular-level origins of chemical behavior in condensed phases and clusters.

**Gustavo Scuseria**<sup>7,8</sup>, PhD (U Buenos Aires, 1983). Development of theoretical and computational quantum chemistry techniques (many in the Gaussian program). Application of quantum mechanics to predict the structure and properties of molecules.

**Ned Thomas**<sup>3,7</sup>, PhD (Cornell, 1974). Polymer physics and engineering, photonics and phononics and mechanical and optical properties of block copolymers, liquid crystalline polymers, and hybrid organic-inorganic nanocomposites.

**James Tour**<sup>4,7</sup>, PhD (Purdue, 1986). Organic chemistry, materials science, polymer chemistry, nanoscience, and nanotechnology.

**R. Bruce Weisman**<sup>7</sup>, PhD (U Chicago, 1977). Basic studies of carbon nanotube spectroscopy and photophysics and related analytical, mechanical engineering and biomedical applications.

**Kenton Whitmire**, PhD (Northwestern, 1982). Inorganic and organometallic chemistry, precursor design for advanced nanomaterials, structural and mechanistic chemistry, catalysis, bioactivity of heavy main group elements.

**Lon Wilson**, PhD (U Washington, 1971). Nanoparticle development in biology and medicine. Nanotechnologically-enhanced medical imaging and therapeutic agents.

**Peter Wolynes**<sup>7,8</sup>, PhD (Harvard, 1976). Theoretical chemical physics, theory of glasses, protein dynamics and folding. Stochastic cell biology.

**Michael Wong**<sup>3,7</sup>, PhD (MIT, 2000). Chemical engineering, chemistry, and materials science, functional nanoparticle-based materials.

**Han Xiao**<sup>1</sup>, PhD (Scripps Research Institute, 2015). Synthetic chemistry, chemical biology, molecular biology, cancer biology, and immunology.

**Boris Yakobson**<sup>7</sup>, PhD (Russian Acad. of Sciences, 1982). Theory and modeling of materials derived from macroscopic and fundamental molecular interactions.

**Eugene Zubarev**<sup>7</sup>, PhD (Russian Acad. of Sciences, 1998). Organic chemistry and polymer chemistry, synthesis and characterization of self-assembling molecules.
