Which Chemistry Class is Right for Me?

This document is designed to help you select the appropriate chemistry course to take during your first year. For any questions, please refer to the notes below and consult an appropriate academic advisor.

CHEM 121/123 – General Chemistry and General Chemistry Laboratory
CHEM 121 is the first-year chemistry course most freshmen take. It is an introduction to chemical phenomena emphasizing problems and methods in chemistry. Students must also register for CHEM 123, the laboratory course that accompanies the lecture. Please refer to the CHEM 123 syllabus for important information regarding lab enrollment.

CHEM 151/153 – Honors Chemistry and Honors Chemistry Laboratory
CHEM 151 is a first-year chemistry course aimed at students who plan on majoring in a chemistry-related field and/or taking upper division chemistry courses later in their college career. It is a deeper introduction to chemical phenomena emphasizing principles and theories in chemistry. This course is strongly recommended for chemistry majors. Students must also register for CHEM 153, the laboratory course that accompanies the lecture.

CHEM 211 – Organic Chemistry
CHEM 211 is typically taken during the second year at Rice, but some students with a very strong AP chemistry background should be adequately prepared to take this course during their freshman year. This course covers the chemistry of aliphatic and aromatic compounds with emphasis on structure, functional groups, bonding, and reaction mechanisms. Because CHEM 211 is offered in both the fall and spring semesters, some students elect to wait until the spring semester to take CHEM 211 to accommodate a challenging fall semester or to better adapt to college. The organic chemistry laboratory course (CHEM 215/217) is NOT a co-requisite.

Notes:
1. **Need CHEM credit?** Not all degrees require chemistry beyond the first year – please check the General Announcements for more information regarding specific degree requirements. All pre-health professional tracks require at least one year of chemistry. AP Chemistry credit counts towards the Group 3 distribution requirement. Of course, you can also take additional Chemistry courses without it being a requirement for your degree plan.
2. **Confident?** Many students who have AP Chemistry credit are not confident in their knowledge of chemistry. This may depend on the quality and rigor of your high school courses, or it may depend on how many years it has been since you took your AP course. Many students find it helpful to take General Chemistry at Rice, and thus forgo their AP credit, to solidify their background in chemistry for advanced course work or for professional school requirements.
3. **Consult OAA.** Some medical schools do not accept AP credit for application to medical school. As such, you should seek advice about whether to take your AP credit or take the course. Contact the Office of Academic Advising (OAA) or refer to their website ([www.oaa.rice.edu](http://www.oaa.rice.edu)) for more information.
